

Variables in C

Topics

- What is Variable
- Naming Variables
- Declaring Variables
- Using Variables
- The Assignment Statement

What Are Variables in C?

- Variables are the names that refer to sections of memory into which **data can be stored**.
- **Variables** in C have the same meaning as variables in algebra. That is, they represent some unknown, or variable, value.

$$x = a + b$$

$$z + 2 = 3(y - 5)$$

- Remember that variables in algebra are represented by a single alphabetic character.

Naming Variables

- Rules for variable naming:
 - Can be composed of letters (both uppercase and lowercase letters), digits and underscore only.
 - The first character should be either a letter or an underscore(not any digit).
 - Punctuation and special characters are not allowed except underscore.
 - Variable name should not be keywords.
 - names are case sensitive.
 - There is no rule for the length of a variable name.
However, the first 31 characters are discriminated by the compiler. So, the first 31 letters of two name in a program should be different.

Reserved Words (Keywords) in C

• auto	break	int	long
• case	char	register	return
• const	continue	short	
• default	do	signed	
• double	else	sizeof	static
• enum	extern	struct	
• float	for	switch	
• goto	if	typedef	union
		unsigned	void
		volatile	while

Naming Conventions

- C programmers generally agree on the following **conventions** for naming variables.
 - Begin variable names with lowercase letters
 - Use meaningful identifiers
 - Separate “words” within identifiers with underscores or mixed upper and lower case.
 - Examples: `surfaceArea` `surface_Area`
`surface_area`
 - Be consistent!

Naming Conventions (con't)

- Use all uppercase for **symbolic constants** (used in **#define** preprocessor directives).
- Examples:

```
#define PI 3.14159
```

```
#define AGE 52
```

Case Sensitivity

- **C is case sensitive**
 - It matters whether an **identifier**, such as a variable name, is uppercase or lowercase.
 - Example:

area

Area

AREA

ArEa

are all seen as different variables by the compiler.

Which Are Legal Identifiers?

AREA

area_under_the_curve

3D

num45

Last-Chance

#values

x_yt3

pi

num\$

%done

lucky***

Declaring Variables

- Before using a variable, you must give the compiler some information about the variable; i.e., you must **declare** it.
- The **declaration statement** includes the **data type** of the variable.
- Examples of variable declarations:

`int meatballs ;`

`float area ;`

Declaring Variables (con't)

- When we declare a variable
 - Space is set aside in memory to hold a value of the specified data type
 - That space is associated with the variable name
 - That space is associated with a unique **address**
- Visualization of the declaration

```
int meatballs ;
```

meatballs

FE07

More About Variables

C has three basic predefined data types:

- Integers (whole numbers)
 - **int**
- Floating point (real numbers)
 - **float**,
 - **double**
- Characters
 - **char**

Using Variables: Initialization

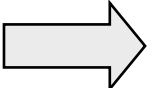

- Variables may be given initial values, or **initialized**, when declared. Examples:

`int length = 7 ;` 

length
7

`float diameter = 5.9 ;` 

diameter
5.9

`char initial = 'A' ;` 

initial
'A'

Using Variables: Initialization (con't)

- Do not “hide” the initialization
 - put initialized variables on a separate line
 - a comment is always a good idea
 - Example:

```
int height ;      /* rectangle height */  
int width = 6 ;   /* rectangle width   */  
int area ;        /* rectangle area    */
```

NOT `int height, width = 6, area ;`

Using Variables: Assignment

- Variables may have values assigned to them through the use of an **assignment statement**.
- Such a statement uses the **assignment operator =**
- This operator does not denote equality. It assigns the value of the righthand side of the statement (the **expression**) to the variable on the lefthand side.
- Examples:

diameter = 5.9 ;

area = length * width ;

Note that only single variables may appear on the lefthand side of the assignment operator.

Example: Declarations and Assignments

```
#include <stdio.h>
```

```
int main( )  
{
```

```
    int inches, feet, fathoms ;
```

```
    fathoms = 7 ;
```

```
    feet = 6 * fathoms ;
```

```
    inches = 12 * feet ;
```

```
    .
```

```
    .
```

```
    .
```

Example: Declarations and Assignments (cont'd)

```
    •  
    •  
    •  
    printf ("Its depth at sea: \n") ;  
    printf ("    %d fathoms \n", fathoms) ;  
    printf ("    %d feet \n", feet) ;  
    printf ("    %d inches \n", inches) ;  
  
    return 0 ;  
}
```

Enhancing Our Example

- What if the depth were really 5.75 fathoms? Our program, as it is, couldn't handle it.
- Unlike integers, floating point numbers can contain decimal portions. So, let's use floating point, rather than integer.
- Let's also ask the user to enter the number of fathoms, rather than “**hard-coding**” it in.

Enhanced Program

```
#include <stdio.h>
int main ( )
{
    float  inches, feet, fathoms ;

    printf ("Enter the depth in fathoms : ") ;
    scanf ("%f", &fathoms) ;
    feet = 6 * fathoms ;
    inches = 12 * feet ;
    printf ("Its depth at sea: \n") ;
    printf ("    %f fathoms \n", fathoms) ;
    printf ("    %f feet \n", feet) ;
    printf ("    %f inches \n", inches) ;
    return 0 ;
}
```

Final “Clean” Program

```
#include <stdio.h>
int main( )
{
    float inches ;    /* number of inches deep */
    float feet ;      /* number of feet deep */
    float fathoms ;   /* number of fathoms deep */

    /* Get the depth in fathoms from the user */

    printf (“Enter the depth in fathoms : ”) ;
    scanf (“%f”, &fathoms) ;

    /* Convert the depth to inches */

    feet = 6 * fathoms ;
    inches = 12 * feet ;
}
```

Final “Clean” Program (con’t)

```
/* Display the results */
```

```
printf (“Its depth at sea: \n”) ;
```

```
printf (“    %f fathoms \n”, fathoms) ;
```

```
printf (“    %f feet \n”, feet);
```

```
printf (“    %f inches \n”, inches);
```

```
return 0 ;
```

```
}
```

Good Programming Practices

- Place each variable declaration on its own line with a descriptive comment.
- Place a comment before each logical “chunk” of code describing what it does.
- Do not place a comment on the same line as code (with the exception of variable declarations).
- Use spaces around all arithmetic and assignment operators.
- Use blank lines to enhance readability.

Good Programming Practices (con't)

- Place a blank line between the last variable declaration and the first executable statement of the program.
- Indent the body of the program 3 to 4 tab stops -- be consistent!
